University Bookshop Receipt

City University of Hong Kong,

Tat Chee Avenue, Kowloon, Hong Kong

Receipt ID: 9873

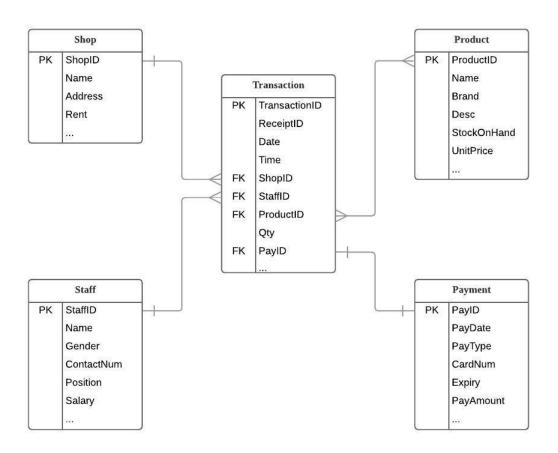

Staff ID: 1234 26th September 2019

9:00am

Staff Name: Chris Chan

| Item | Quantity | Price | Amount |
|------------------------|---------------------|-------|--------|
| #001: Pencil | 2 | \$6 | \$12 |
| #003: Experiencing MIS | 1 | \$300 | \$300 |
| | | | |
| | | Total | \$312 |
| | | | |
| Payment | | | |
| Visa | 1234 xxxx xxxx 5678 | | \$312 |

University Book Store ER diagram Example 1

Many-to-many relationship is not preferred in a relational database because it is inefficient and managing all records tied to each side of relationship is difficult. When you look at the receipt, it contains multiple items, imagine how should you set up the transaction table? Would it be:

| TransactionID | ReceiptID | Date | Time | ShopID | StaffID | ProductID | Qty | PayID |
|---------------|-----------|-----------|--------|--------|---------|-----------|-----|-------|
| 0002500 | 9873 | 26/9/2019 | 9:00am | CityU1 | 1234 | #001 | 2 | 01 |
| 0002501 | 9873 | 26/9/2019 | 9:00am | CityU1 | 1234 | #003 | 1 | 01 |

Or

| TransactionID | ReceiptID | Date | Time | ShopID | StaffID | ProductID1 | Qty1 | ProductID2 | Qty2 | PayID |
|---------------|-----------|-----------|--------|--------|---------|------------|------|------------|------|-------|
| 0002500 | 9873 | 26/9/2019 | 9:00am | CityU1 | 1234 | #001 | 2 | #003 | 1 | 01 |

But what if the customer purchases more items? How many duplicate records or columns will you need to add?

Therefore, we need a "bridging table", Transaction LineItem/Detail table to eliminate M:N relationship. With this bridging table, it breaks down a M:N relationship to become two 1:N relationships as in the following diagram.
